What's Wrong with the Multi-Cloud Model - Nothing!

By: ShariLee Beynon
sharileeb@gmail.com

The multi-cloud model, also called a hybrid, is a delivery strategy, which is composed of a private or internal cloud in combination with a public or external cloud, each of which is distinct--albeit interoperable.

Furthermore, "A recent survey conducted by [451 Research](#) indicates that 70% of organizations have multiple clouds in use today and that 37% of organizations surveyed by 451 Research have already deployed hybrid cloud solutions."

This, 451 Research also reports "is providing the ability for multiple clouds to interact almost seamlessly and as 'best execution venues' (such as leveraging private cloud for data protection and public cloud for cheap compute)."

Currently, using cloud and multi-clouds as a pipeline, in order to connect your remote mobile users and locations to your cloud-based applications, is proving to be the route to greater efficiency for an enterprise in a myriad of ways. Nevertheless, what about security?

Security risk has always been the top concern for any company. Cloud-based service company's assurances that their customer's systems are secure, encourages the customer to be confident in their use of the cloud for storage, networking, and for all of their computing across their enterprise.

However, security is still the elephant in the room, and innovative, non-disruptive security services must be in place in order to minimize risk.

Regardless of whether a customer is a small cloud user, where there are multiple users, or a larger user with an exclusive data center--high-priority security technology, aggressively improved on a continuing basis should progressively engage a cloud provider's assets.

██████████ is no exception! When it comes to your security, we consult with you personally on which cloud managed service would be best to handle your workload. Our team immediately goes to work guiding you on ways to anticipate future traffic,
